

Cellpose-SAM: fast-mode mask IoU agreement on 2D images

FP16 with GPU preprocessing and tiling compared with unmodified standard bfloat16 inference

Object score: smaller of reference/prediction mean IoU after one-to-one matching at IoU >= 0.5. Missing/extra counts: repeat maxima.

Agreement measures similarity to standard inference, not accuracy against manual annotations. Fast-mode mask bytes differ in every configuration.

Markers: mean agreement across 5 repeats; whiskers: observed min-max. RTX PRO 6000 Blackwell. Flow QC and iterations retained.
